Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

A. Title: Isolation of cDNAs encoding the catalytic domain of poly(ADP-ribose)polymera
A. Reference number: PNO494; MUID:93277538
A. Reference number: PNO495
A. Molecule type: mRNA
A. Residues: 742-745, E', 747-876 < COZA
C. Comment: This zinc-finger protein plays a role in DNA repair, cell growth, and diff
C. Superfamily: NAD+ ADP-ribosyltransferase
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Keywords: DNA binding; glycosyltransferase; hexosyltransferase; NAD; nucleus;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               A47474
NAD+ ADP-ribosyltransferase (EC 2.4.2.30) - fruit fly (Drosophila melanogaster)
     N;Alternate names: poly ADP-ribose polymerase
C;Species: Xenopus laevis (African clawed frog)
C;Date: 22-Nov-1993 #sequence_revision 10-Nov-1995 #text_change 20-Jun-2000
C;Accession: S31735; PN0495
R;Saulier-le Drean, B.M.
submitted to the EMBL Data Library, May 1992
A;Reference number: S31735
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    C;Species: Drosophila melanogaster

A; Molecule type: mRNA
A; Residues: 1-983 < DOU>
A; Residues: 1-983 < DOU>
A; Residues: 1-983 < DOU>
A; Experimental source: cultivar landsberg erecta
C; Genetics:
A; Gene: parp-1
C; Function:
A; Description: ADP-ribose polymer synthesis
C; Superfamily: NAD+ ADP-ribosyltransferase
C; Keywords: DNA binding; glycosyltransferase; NAD;

A;Title: Sequence and analysis of chromosome 2 of the pla
A;Reference number: A84420; MUID:20083487
A;Accession: C84719
A;Status: preliminary
A;Molecule type: DNA
A;Residues: 1-1009 <STO>
A;Cross-references: GB:AE002093; NID:g4432827; PIDN:AAD20
C;Genetics:
A;Gene: At2g31320
A;Map position: 2
C;Superfamily: NAD+ ADP-ribosyltransferase
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           probable poly (ADP-ribose) polymerase [imported] - Arabidopsis thaliana (Species: Arabidopsis thaliana (mouse-ear cress) C;Species: Arabidopsis thaliana (mouse-ear cress) C;Date: 02-Feb-2001 #sequence_revision 02-Feb-2001 #text_change 16-Feb-2001 C;Accession: C84719 R;Lin, X.; Kaul, S.; Rounsley, S.D.; Shea, T.P.; Benito, M.I.; Town, C.D.; Fujii, C.Y.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            ò
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          ö
                                                                                                                                      polymerase (PARP) homologues, which are characterised by an amino acid sequence with a functional NAD<sup>+</sup>-binding site and no zinc finger sequence motif, of general formula CX_2CX_ZHMX_ZC (I). The nucleic acid sequences, PARP homologues and antibodies are useful for analytic detection of PARP homologues and for identifying PARP effectors or binding partners, as well as for determining their effectiveness. PARP-binding partners are useful for the diagnosis or therapy of a disease condition, which is the result of a PARP protein, especially an energy deficiency, which may comprise tissue damage from cell death following necrosis or apoptosis. The disease condition may be chosen from a neurodegenerative illness, or sepsis or ischemic tissue damage, in particular neurotoxic disturbances, etc. This sequence represents the murine PARPI protein used in the method of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                240
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               300

polymerase (PARP) homologues, which are characterised by an amino acid sequence with a functional NAD^+-binding site and no zinc finger sequence motif, of general formula CX_ZZYAHKZC (1). The nucleic acid sequences, PARP homologues and antibodies are useful for analytic detection of PARP homologues and for identifying PARP effectors or binding partners, as well as for determining their effectiveness. PARP-binding partners are useful for the diagnosis or therapy of a disease condition, which is the result of a PARP protein, especially an energy deficiency, which may comprise tissue damage from cell death following necrosis or apoptosis. The disease condition may be chosen from a neurodegenerative illness, or sepsis or ischemic tissue damage, in particular neurotoxic disturbances, etc. This sequence represents the murine PARPI protein used in the method of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        240
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                121 DFKKKFWEKTKNKWEERDRFVAQPNKYTLIEVQGEAESQEAVVKALSPQVDSGPVRTVVK 180

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        This invention describes novel human and murine poly(ADP-ribose)
polymerase (PARP) homologues, which are characterised by an amino acid
sequence with a functional NAD<sup>+</sup>-binding site and no zinc finger
sequence motif, of general formula CX_2CX_ZMHX_ZC (I). The nucleic acid
sequences, PARP homologues and antibodies are useful for analytic
detection of PARP homologues and for identifying PARP effectors or
binding partners, as well as for determining their effectiveness.
PARP-binding partners are useful for the diagnosis or therapy of a
disease condition, which is the result of a PARP protein, especially an
energy deficiency, which may comprise tissue damage from cell death
following necrosis or apoptosis. The disease condition may be chosen
from a neurodegenerative illness, or sepsis or lschemic tissue damage,
in particular neurotoxic disturbances, etc. This sequence represents the
human PARP3 protein used in the method of the invention.

                                                                                                                                                                                                                                           'n,
                                                                              detection of PARP homologues and for identifying PARP effectors or binding partners, as well as for determining their effectiveness. PARP-binding partners are useful, for the diagnosis or therapy of a disease condition, which is the result of a PARP protein, especially an energy deficiency, which may comprise tissue damage from cell death following necrosis or apoptosis. The disease condition may be chosen from a neurodegenerative illness, or sepsis or ischemic tissue damage, in particular neurotoxic disturbances, etc. This sequence represents the human PARP3 protein used in the method of the invention.
                                      polymerase (PARP) homologues, which are characterised by an amino acid sequence with a functional NAD^+-binding site and no zinc finger sequence motif, of general formula CX_2CX_2MHX_2C (I). The nucleic acid sequences, PARP homologues and antibodies are useful for analytic

The invention relates to antisense oligonucleotides targeted to human PARP nucleic acid and inhibiting expression of human PARP. PARP (Poly (ADP-ribose) polymerase plays an important role in chromatin decondensation, DNA replication, DNA repair, gene expression, malignant transformation, cellular differentiation and apoptosis. The antisense oligonucleotide inhibitors are useful for inhibiting the expression of PARP in human cells or tissues. They are also useful for treating a human with a disease associated with PARP especially hyperproliferative disorders (e.g. cancer), cellular injury resulting from oxidative stress, neurological (e.g parkinsonism, meningitis-associated intracranial complications and ischaemia), inflammatory and autoimmune disorders (e.g arthritis) and diabetes. The present sequence is a PARP protein, the CANA encoding which was used to design the antisense
cytostatic; nootropic; neuroprotective; antiinflammatory; antidiabetic; immunosuppressant; hyperproliferative disorder; cancer; cellular injury; oxidative stress; neurological disorder; parkinsonism; apoptosis; meningitis-associated intracranial complication; ischaemia; inflammatory disorder; autoimmune disorder; arthritis; diabetes.

Modulating cell death, growth and stress resistance in eukaryotes, specifically plants, used, e.g. to impart fungus or nematode resistance Claim 18; Page 92-95; 126pp; English.

The present sequence represents the NAP protein of Zea mays. This protein is a poly(ADP-ribose) polymerase (PARP) protein (also known as potein is a poly(ADP-ribose) transferase). The PARP enzyme is involved in programmed cell death or apoptosis, and is a nuclear enzyme. The NAP polynucleotide sequences can be used for modulation of programmed cell death in extent to reverte against, programmed cell death, depending on the extent to which PARP activity is reduced. Reducing expression of endogenous NAP class PARP only is also used to modulate programmed cell death, to increase growth rate and to produce plant cells that are more tolerant of stress (cold chemical treatments, pathogens, pests, drought, heat, etc., or during transformation). Particular applications are generation of plants that are resistant to fungi or nematodes; are male or female sterile; or have better seed-shatter properties. The methods are also used to improve growth of transformed plant cells (and derived calli or complete plants).
